

## Maintenance Instructions

### Maintenance Instructions for DAMPA Steel - and Aluminium Ceilings.

#### Inspection Instructions:

DAMPA requires no regular inspections of the ceilings.

#### Maintenance Instructions:

The ceiling can be vacuum cleaned by using a smooth nozzle brush.

For possibly washing the ceiling we recommend to use ordinary detergent or liquid soap. The detergent is to be mixed with water in the ratio of 1:70. Apply the solution by a sponge and wipe off the ceiling by a soft cotton cloth firmly wrung in pure water.

Spots, stripes or blotches, which cannot be removed in this way, should be treated with liquid soap mixed in the ratio of 1:10. Usually this solution will make even smoke-blackened areas disappear. The solution is to be applied to the ceiling by using a soft sponge firmly wrung in the solution. After a few seconds the soap and loose dirt are removed by means of soft cotton cloths or sponges, which frequently are to be washed in pure water and firmly wrung. Smoke-blackened areas, which do not disappear by means of ordinary cleaning, are to be swabbed with 40% acetic acid. Subsequently the areas in question are to be washed with pure water with an admixture of 1% ammonia water.

#### Demounting or Remounting Instructions:

Should normally be made only by skilled persons.

Tiles in a concealed suspension system: Demount the first tile by inserting DAMPA's dismantling tool in the joint close to a corner and pull carefully downwards.

DAMPA 10/100/200/300: Demount a profile by pulling it towards you horizontally and simultaneously pushing the nearest adjacent one.
