

Operations and Maintenance

DAMPA steel and aluminium ceilings

Maintenance and cleaning instructions

Wipe the ceiling with a soft cloth or vacuum it with a soft nozzle brush when needed.

We recommend using a regular mild household detergent to wash the ceiling. Apply the soap solution to the ceiling with a natural sponge and wipe it off with a soft cotton cloth wrung in clean water.

Use an ammonia-containing detergent for particularly greasy surfaces.

We do not recommend using scouring agents or cleaning products with a low PH-value for steel ceilings.

In areas with high humidity and frequent cleaning, we recommend ceilings with a special surface coating.

Demounting instructions

Demounting and installation should only be done by professionals. You can download installation guides from our website or have them sent to you per request.

We recommend using clean cotton gloves during demounting and installation to avoid contaminating the ceiling surfaces.

Please ensure compliance with current health and safety regulations during cleaning, as well as demounting and installation.

Use DAMPA's demounting tool to remove DAMPA® Clip-In and DAMPA® Interval 90/10 - 290/10 to avoid damaging the ceiling elements. We refer to separate demounting guides for correct demounting.

You can order the demounting tools by contacting our customer service.

Inspection instructions

There are no supplier requirements for regular inspection.
